RADIOTHERAPY FOR SKIN CANCER

What are the aims of this leaflet?

This leaflet has been written to help you understand more about radiotherapy treatment for skin cancer.

What is radiotherapy?

Radiotherapy is the use of X-rays to destroy cancerous cells. In the skin, it is mainly used to treat basal cell carcinomas and squamous cell carcinomas although other conditions may also benefit from the therapy.

When is radiotherapy used?

- When the cancer is too large or in a difficult site for surgery.
- When the patient does not want surgery or is not fit enough for surgery.
- When radiotherapy may give a better cosmetic result than surgery (for instance, some cancers on the nose).
- When there has been an operation to remove the cancer and it is considered that radiotherapy might reduce the risk of the cancer returning.

Where will you receive the treatment?

Radiotherapy for skin cancer is given as an outpatient procedure in a Radiotherapy Department. Generally, you will not need to be admitted to hospital. Several outpatient visits are usually required.

What is the duration of the treatment?

For small cancers the treatment is often over a period of approximately 2 weeks, whilst for larger cancers, particularly squamous cell carcinomas, it may be over about 4 weeks.
Planning your treatment

When you come for radiotherapy, the area of the skin to be treated will be marked using a marker pen by an oncologist (doctor specialising in treatment of cancer). These ink marks will be used to line up the machine each time you are treated. Usually a photo is taken with the ink marks around the cancer but you may be asked to keep these marks until the treatment has been completed. If the area to be treated is on your head and is large or complex, it may be necessary to make a plastic mask that rests on your face to help you and the staff to get you in the same position for each treatment. The staff who are looking after you will explain about this in more detail if it is needed. A special lead cut-out may be used to shape the radiotherapy beam and protect the surrounding skin.

Having your treatment

At the beginning of your treatment you should be given a written information leaflet on how to care for yourself during radiotherapy. The actual treatment only takes a few minutes. The radiographer will position you on a couch and make sure that you are comfortable, because you have to lie very still during the treatment. If your skin cancer is near your eye or teeth, a small lead shield will be applied during treatment to protect these areas from the radiation. You will be left alone while you have your treatment, but the radiographer will be able to hear and see you.

You will not be able to see or feel the radiotherapy as it is not painful.

Radiotherapy does not make you radioactive. It is perfectly safe to be with other people, including children, throughout your course of treatment.

Are there any side effects?

Radiotherapy for skin cancer only affects the area treated. You will not feel sick or tired from the treatment, or lose your hair, unless your skin cancer is in an area covered by hair. You should be able to continue your usual activities or work throughout your treatment, and any side effects you experience will be monitored regularly by a doctor/radiotherapist. The side effects normally occur in the latter part of the treatment and may continue for some weeks after completion. After the treatment, the affected skin will become red and sore, like sunburn. This reaction can take several weeks to settle. The area may become crusty and scab over, sometimes more than once. When the scab falls off, there will be good skin underneath. Scarring from radiotherapy is usually mild, but over years the scar tends
to become paler (any such scarring may benefit from skin camouflage assistance; further information can be found below).

**How should you look after your skin?**

While on treatment you should wash the area with mild soap or aqueous cream and keep it as dry as possible. You should not apply any cream or lotions to the treated area until any reaction from the treatment has settled down; this includes cosmetics and sunblock if you are having your face treated. If you are having treatment near the hair line be careful when washing your hair and do not use a hair dryer near the area being treated but allow it to dry naturally. It is better to keep the treated area out of strong winds and sunlight as these can irritate the skin and make the reaction worse. Try to avoid clothes rubbing the treated area.
